

Steinberg $\tilde{\sigma}_u \odot \tilde{\sigma}_s$ pre-saturation law -- $X^{5,q}$, $q \in 13, 17, 29$

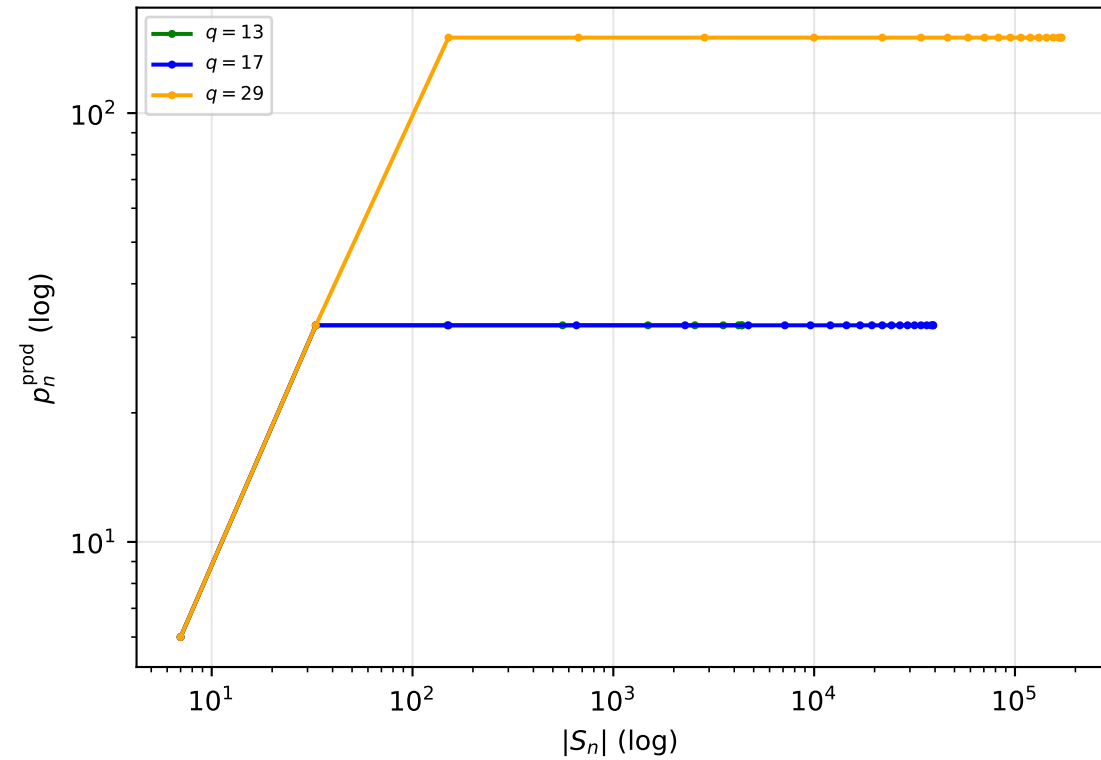

Admissible frontier fraction (linear)

Decay shape (semi-log)

Cumulative admissible front (log-log)

Summary

PARAMETER STABILITY

Saturation thresholds vs q :

$q = 13$: $|S^*| = 33$, $|S^*|/|G| = 0.00755$

$q = 17$: $|S^*| = 33$, $|S^*|/|G| = 0.00084$

$q = 29$: $|S^*| = 151$, $|S^*|/|G| = 0.00089$

$|S^*| \sim q^{2.03}$

β_{prod} stability:

Note: $\beta_{\text{prod}} \approx 1.7$ is outside

$\beta^* \in (0.09, 0.13)$; governed by

$O(q)$ pre-saturation window only.
