

Version A vs B (character-based) on $X^{5,13}$, shell-layered cascade
PGL(2,13): $|G| = 2184$, $n_{\text{adm}} = 13$, $\text{rank}(M_{\text{adm}}) = 13$, $r_A = \text{rank}(P_A) = 6$

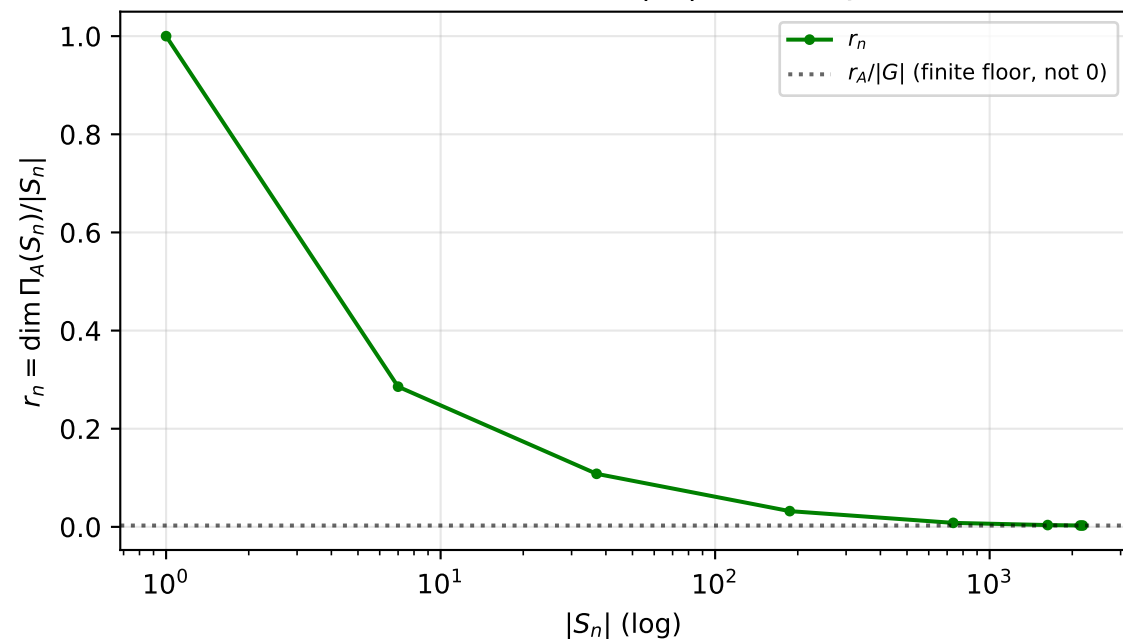

Rank of admissible span (shell-layered)

Shell-wise novelty fraction

Finite bound $r_n \leq r_A/|S_n|$ (Corollary~1)

Summary

KEY NUMBERS ($q=13$, $p=5$), shell-layered:

Group: PGL(2,13)

$|G| = 2184$

Generators in 1 conjugacy class(es)

$n_{\text{adm}} = 13$ of 15 classes

$\text{rank}(M_{\text{adm}}) = 13$

$r_A = \text{rank}(P_A) = 6$ (7 admissible sectors have $\kappa_\rho = 0$)

VERSION A (empirical, this traversal only):

$\dim \Pi_A(S_n)$ reaches r_A at $|S_n| \approx 187$

VERSION B (character, layered):

Max $\dim \Pi_B^{\leq n}$: 3

Late $\tilde{r}^B$: 0.170
