

Steinberg $\tilde{\sigma}_u \odot \tilde{\sigma}_s$ pre-saturation law -- $X^{5,q}$, $q \in 13, 17, 29$, shell-layered

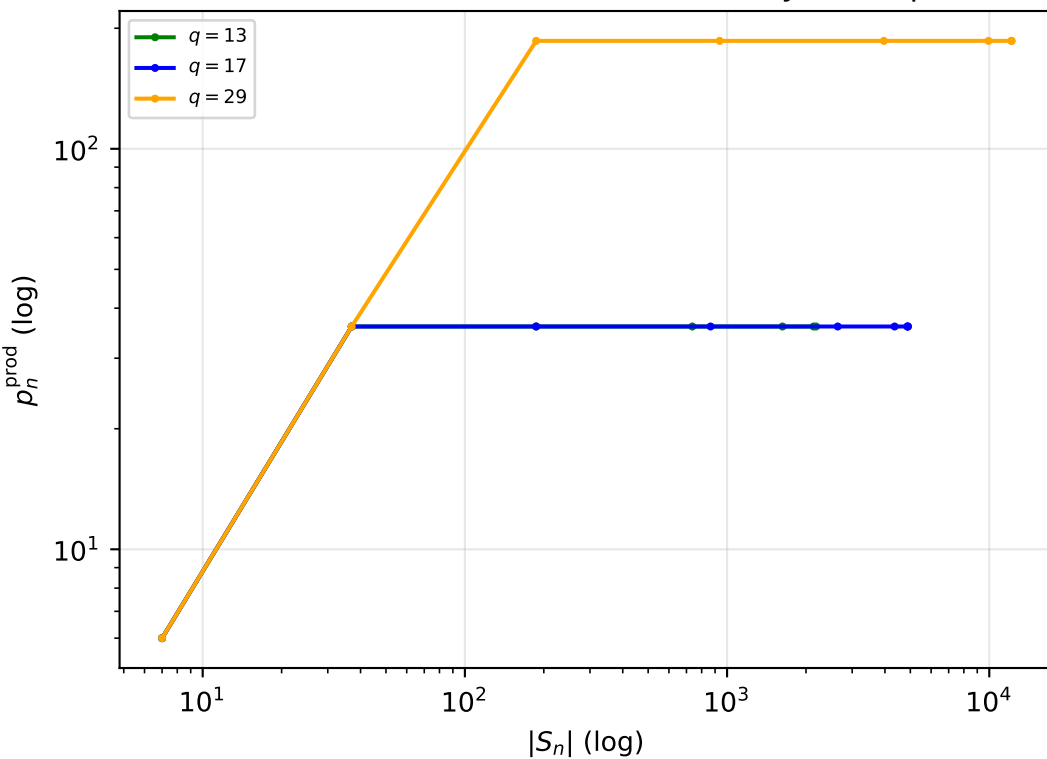

Admissible frontier fraction

Decay shape (log-log)

Cumulative admissible front (reference only; no exponent fit)

Summary

PARAMETER TABLE (shell-layered, verified group)

$q=13$ (PGL): $|G|=2184$, $|S^*|=37$, $|S^*|/|G|=0.01694$
 $q=17$ (PGL): $|G|=4896$, $|S^*|=37$, $|S^*|/|G|=0.00756$
 $q=29$ (PSL): $|G|=12180$, $|S^*|=187$, $|S^*|/|G|=0.01535$

Usable pre-saturation windows for a beta_prod fit: 0/3
 Saturation occurs inside the local tree-like regime
 shared by every tested q (shell sizes 1,6,30,150,... match
 the free 6-regular tree exactly before any collision).
